The Effect of the Tempering Temperature on the Diffusion and Solubility of Hydrogen in Hardened Steel

hydrogen gas was measured using Edwards' apparatus (Ref.14). A normal aqueous solution of sulphuric acid, containing 3 mg of arsenic in 1 litre of solution, served as the electrolyte. A steel plate was used as the cathode and a platinum spiral served as the anode. The current density was  $0.06 \text{ A/cm}^2$ . The amount of hydrogen (ml/100 g) which diffused through the steel plate was plotted against the duration of electrolysis (Fig.1). Electrolysis was continued until the rate of diffusion of hydrogen through steel became constant, as indicated by the rectilinearity of the plot in Fig.1. In parallel with these diffusion experiments, the amount of hydrogen absorbed in steel was measured. This was done by saturating steel with hydrogen so that no more gas was absorbed and then outgassing the steel plate by heating it in vacuum at  $600^\circ\text{C}$ . The diffusion (permeability to hydrogen) and the absorption results are given in Columns 3 and 4 in a table on p.840: Col.2 of that table gives the Brinell hardness H ( $\text{kg/mm}^2$ ). With increase of the temper temperature (Col.1 in the table) the

AUTHOR: Savitskiy, V. G.; Popov, K. V.

TITLE: The role of relaxation phenomena in metal deformation at low temperatures

CITED SOURCE: Sb. Relaksats. yavleniya v met. i splavakh. M., Metallurgizdat, 1963, 300-302

TOPIC TAGS: relaxation phenomenon, metal deformation, low temperature, external loading, plastic deformation

TRANSLATION: Analyses the interaction between the process of external loading and the internal relaxation processes caused by it. For metals with a tendency toward cold brittleness, a drop in the test temperature hinders the occurrence of plastic deformation. The stress necessary for operation of the Franck-Reid sources increases due to a decrease of the role of temperature fluctuations. Simultaneously with a drop in temperature there is an increase in the anisotropy of the forces of shear along various crystallographic planes. There is considerable increase in the heterogeneity of deformation in the initial stages of deformation. The

Card 1/2

L 11301-65

ACCESSION NR: AR4044009

combined effect of these factors hinders stress relaxation due to local shear in individual volumes near the point of dislocation pile-up. Normal stresses in the region of the leader of dislocation pile-up can reach a level sufficient to destroy the continuity of the metal and form incipient cracks.

Title : The Treatment of Hypertensive Disease with Small Doses of Quinine in a Solution of Urea

Orig Pub : Voyen.-med. delo (Bulg.), 1957, 12, No 4, 19-24

Abstract : Thirty-three hypertensive patients were treated by the administration of 0.25 percent solution of quinine with urea (8-40 ml. intravenously, twice weekly). The patients remained in the habitual conditions of work and living without any additional treatment, and were carefully investigated from laboratory and clinical aspects (EKG, liver and kidney functions, fundus oculi, urine, blood, E.S.R., urea levels in the blood). In all these investigations no fluctuations whatever, connected with the treatment being followed, were noted. The age of the patients was 20 to 50 years and over, duration of disease 1 to 5 years, and level of blood pressure

The results in asepsis and antisepsis obtained by application on the skin of a special resinous, occlusive and antiseptic mixture composed of : resina benzoe - 5.0, hydrargyrum oxycyanatum - 1.0 and pure alcohol (99 or 100%) ad 100, are reported. A resinous cover (invisible and not injuring the skin) is obtained which warrants a sufficiently lasting and secure asepsis acting as a substitute for the rubber glove and suitable for urgent use under any circumstances.

TITLE: A Walrus Colony on Peschanyy Island (Lezhbischche morzhey na ostrove Peschanom)

PERIODICAL: Priroda, 1958, Nr 9, pp 102-103 (USSR)

ABSTRACT: Although the walrus occurs less frequently in the western sector of the Soviet Arctic than in the east, there are regions where it is met in large numbers, e.g., the colony on the Peschanyy Island in the Laptev Sea. The author of this article was a member of an Arctic hunting expedition and had the opportunity of observing the close-to-3,000-population walrus colony there in 1953 and 54. The shallow waters round the island abound in food for walruses. The food animals were Gammaracanthus loricatus, Joldia hyperborea, Mya, Saxicava arctica, Buccinum, Neptunea, Priapulus caudatus, Echirus, etc. About 15% of the walruses were young. P.G. Nikulin's statements of 1941 on the behavior, composition and peculiarities of a large walrus colony were found to be true. The most dangerous enemy - except man - to the animals on the island is the bear. There are 2 photographs.

**Hydrogenation of vinylacetylene compounds.** A. L. Kleibanskii, L. D. Popov, and N. Ya. Tsukerman. *J. Russ. Chem. (U.S.S.R.)* 16, 2083-98 (1946) (in Russian).—Vinylacetylene (I) was hydrogenated with Raney Ni at 0°, 20°, and 30° in aq. and alc. media, using a Willstätter vessel with mech. shaking; with 1.05-6 g. catalyst per 460 cc. I; the max. yield of butadiene was 75-89%. Appreciable amounts of I are adsorbed on the catalyst; this may be reduced by diln. with N. Small amounts of butene and butane are also formed. Hydrogenation under 30 atm. pressure in decalin (1:3) at room temp., 50°, and 100°, with Raney Ni gave not only butadiene, but a considerable amt. of butylenes, satd. hydrocarbons, and liquid polymers; the best yield of butadiene (49%) was obtained

when the solvent was omitted at room temp.; higher temps. did not improve the yield. Using a Ni catalyst, prep'd. from the formate on  $\text{Al}_2\text{O}_3$  or charcoal, at 30°, 75°, 100°, 125°, and 150°, the contact time  $t$  of the 1-11 mixt. was varied from 6 sec. to 0.04 sec. The best temp. range was 125-150°, with optimum  $t = 0.5$  sec., the best yield was but 24.7% butadiene; diln. with N led to a 50% yield but caused a sharp reduction of % conversion; the amt. of by-products was only moderately reduced. Electrolytic hydrogenation was performed in an app. made of H-shaped glass vessel, with a Schott disk between the legs, platinized electrodes, the I added at 200 cc./hr., 0.5 amp. at 10 v., at 20°, with 2.5% NaOH as electrolyte; the yield of butadiene did not exceed 34.6%.  $\text{CrCl}_3 \cdot 8\text{H}_2\text{O}$  (70 g.) in 120 cc. 25% HCl was reduced by 30 g. granulated Zn in a  $\text{CO}_2$  atm.; the soln. was poured into 100 cc. 10% HCl and treated with 5 g. I; after shaking 18 hrs. and standing 25 hrs. 37.0% butadiene and 62.4% I were isolated; no by-products were found. Divinylacetylene, bp 28-30°, (5 g.) with 0.0000 g. Pd catalyst on  $\text{BaSO}_4$  in abs. EtOH was hydrogenated at 21° at 50 mm. overpressure until 1600 cc. II was used up; the soln. gave on distn. an unspecified amt. of *trans*-1,5,7-hexatriene, bp 77.5-81.5°, d<sub>25</sub><sup>20</sup> 0.7750, n<sub>D</sub><sup>20</sup> 1.4910, which gave a dibromide, m. 85.5-8.0° (from petr. ether); the maleic anhydride adduct, m. 51° (from petr. ether), gave an anilide, m. 174-5°. The same product was obtained by similar hydrogenation of a tech. mixt. of ethynylvinyl. Similar hydrogenation of a tech. mixt. of acetylene trimers (80:20 mixt. of divinylacetylene and ethynylbivinyl) gave a hexatriene with phys. consts. comparable to those of the *trans*-1,3,6-isomer, above, but gave a maleic adduct, m. 44°, which on hydrolysis gave an acid, m. 158°, thus indicating a possible isomerization to the cis form.

TITLE The temperature dependence of the resistance to deformation and the K-state of nickel chromium alloys

SOURCE Akademiya nauk SSSR. Institut metallurgii. Issledovaniya po zharoprochnym splavam v. 9. 1962. Materialy Nauchnoy sessii po zharoprochnym splavam (1961 g ), 37-40

TEXT Some hardened and cold-worked alloys of the transition elements show a considerable increase in the electric resistance as a result of tempering. This condition is called the K-state. In the present work, the deformation, relaxation, and electric conductance of stressed samples of a nickel alloy containing 9.2 wt % or Cr, which were heated for 2 hours to 950°C and then air cooled, were investigated for a temperature range from room temperature to 600°C. The results show that the relationship between the above properties and the temperature is not linear, and the authors conclude that the most probable transformation taking place in the alloys responsible for the irregularities is the creation of a short-range order in the crystal lattice of the alloy. The variation in electric resistance of the alloy with temperature is the same as for its mechanical properties, which shows that the creation of the K-state is due to the same structural transformation which are responsible for the plastic properties of the alloy. In the discussion N. N. Davidenkov, pointed out that the irregularities in the resistance to deformation at various temperatures may be due to phenomena other than those indicated by the authors, as for instance aging. International Congress of Geophysicists  
(Mezhdunarodnaya Assambleya geofizikov)

PERIODICAL:

Meteorologiya i hidrologiya, 1959, Nr 4, pp 74-77 (USSR)

ABSTRACT:

From July 1, 1957 to December 31, 1958, investigations of our planet were carried out by scientists of 65 countries under the program of the International Geophysical Year (IGY). The 5th Congress of the Special Committee on the International Geophysical Year from July 29 to August 9, 1958 in Moscow was dedicated to the execution of these measures. A short survey of this Congress is given here. -The suggestion by A. A. Zolotukhin on a world-wide organization of evaluations of meteorological data of the IGY in form of synoptic daily world maps, maps of the southern and northern hemispheres, and of vertical sections of the atmosphere, was discussed. The Study Group of Meteorology carried out the following work: on numerical methods of weather forecasts (conducted by I. A. Kibel', Corresponding Member of the AS USSR), on luminous night clouds (conducted by Professor V. V. Sharonov), on meteorology in the Antarctic (conducted by Professor B. L.

Dzerdzevskiy). A. D. Obukhov, Corresponding Member of the AS USSR, and A. S. Monin (Moscow) delivered a report on the theory of the adjustment of quasistatic and quasigeostrophic conditions in the atmosphere for a linear case, and put forward the results of a number of investigations in this direction. I. A. Kibel', Corresponding Member of the AS USSR, and V. P. Sadokov (Moscow), reported on the forecasts of temperature on the earth's surface with help of hydrodynamic methods, and for the first time put forward a scheme for the solution of the quasistatic-quasigeostrophic system of equations for the forecast in consideration of the turbulent heat conductivity. N. I. Buleyev and G. I. Marchuk (Moscow) put forward a new iteration method for the solution of finite difference equations typical for the tasks of the numerical short-termed forecast. Professor M. I. Yudin (Leningrad) suggested some alterations of the forecast equations, thus reducing the area of influence considered in the forecast. He pointed out the necessity of thoroughly testing the methods worked out by many investigators (N. Ye. Kochin and A. A. Dorodnitsyn) for the consideration of the influence of the non-adiabatic factors and of large mountain ranges. O. G. Krichak

TITLE: Fuel pump for injecting light fuel. Class 46, No. 188798. (announced by the Central Scientific Research Institute of Fuel Equipment [Tsentral'nyy nauchno-issledovatel'skiy institut toplivnoy apparatury])

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 22, 1966, 135-136

TOPIC TAGS: pump, fluid pump, engine fuel pump, FUEL INJECTION

ABSTRACT: An Author Certificate has been issued for a fuel pump for injecting light fuel into the cylinders of an internal-combustion engine, which contains plungers, sleeves, and spring-loaded intake valves, the closing moment of which is changed by a moving element with oblique parts for regulating the amount of fuel supplied. To increase fuel-feed accuracy and simplify the design, the intake valves are located inside the pistons, and the moving element is made in form of a rack passing through the sleeves and plungers.
